

A METHOD FOR BATCH PROCESSING RECEIVED MESSAGE PACKETS

ABSTRACT OF THE INVENTION

Embodiments of the present invention are directed to a method for batch
5 processing received message packets. A plurality of message packets are sent
in a batch from a network access layer device to a network layer component
based upon a blanking NIC interrupt. The network layer component classifies
the plurality of message packets and batches them together per transport
connection. The network layer component then sends batches for each
10 transport connection to a transport layer component for transport layer
processing.
